Fender Studio Pro X

A free community expansion that gives you your own version of Fender Studio Pro 8.

Free · Your licensed copy · Licensing untouched · One-click uninstall

Version 1.4.1

Get it free on GitHub
github.com/ferrerokush-png/fender-studio-pro-x

WHAT IT IS

Ten packages that sit on top of the Studio Pro you already own.

Free, for everyone

No price, no account, no sign-up. Our own code, open under the MIT licence.

Your own licensed copy

It installs on your Studio Pro 8. No Fender files are shipped: skins are built on your PC from your own copy.

Licensing is never touched

Sign-in, activation, subscriptions and the store work exactly as before. Nothing here goes near them.

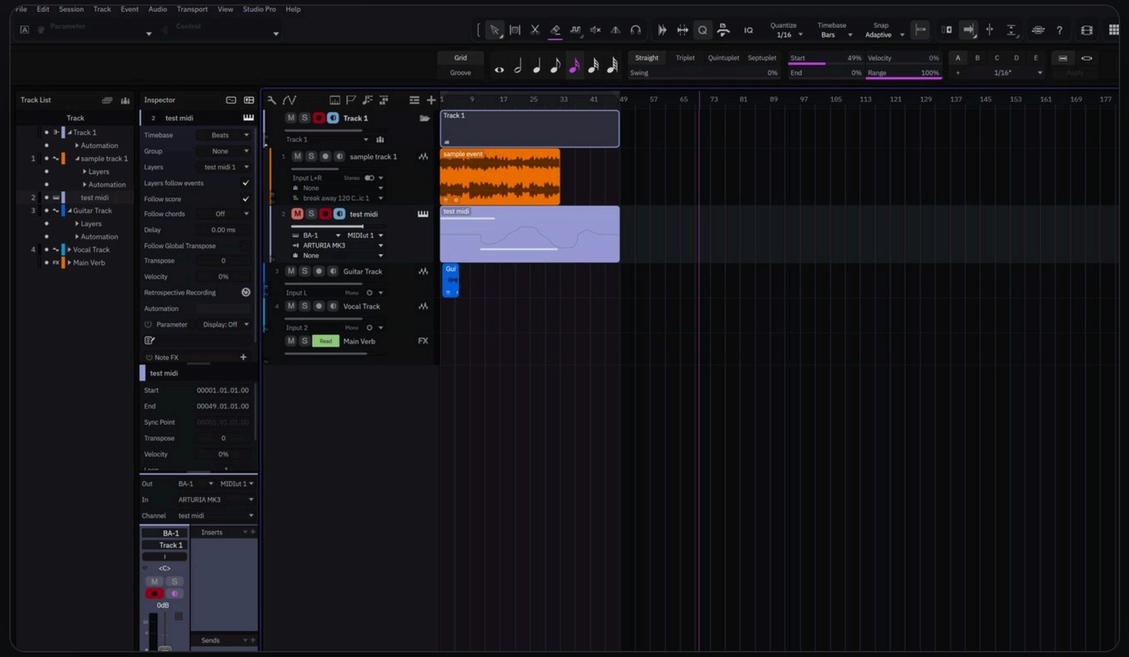

One-click uninstall

Hold `Shift` at start for stock, or run Uninstall and you are back to plain Studio Pro. Or remove just one package.

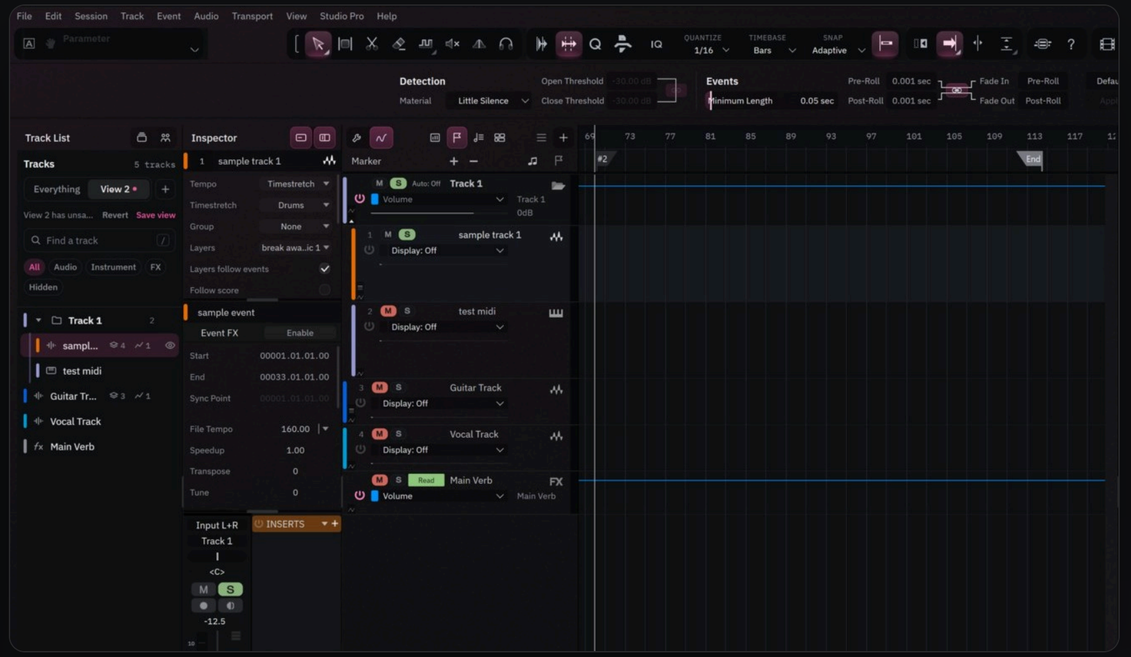

HEADS UP

I'm a producer, not a programmer. I build these mods with AI coding tools and test each release on my own setup, on one Studio Pro build. They change how Studio Pro looks and works, so things can still break, especially after a Studio Pro update. Back up your songs first, use it at your own risk, and if anything acts up, run the uninstaller to go back to stock.

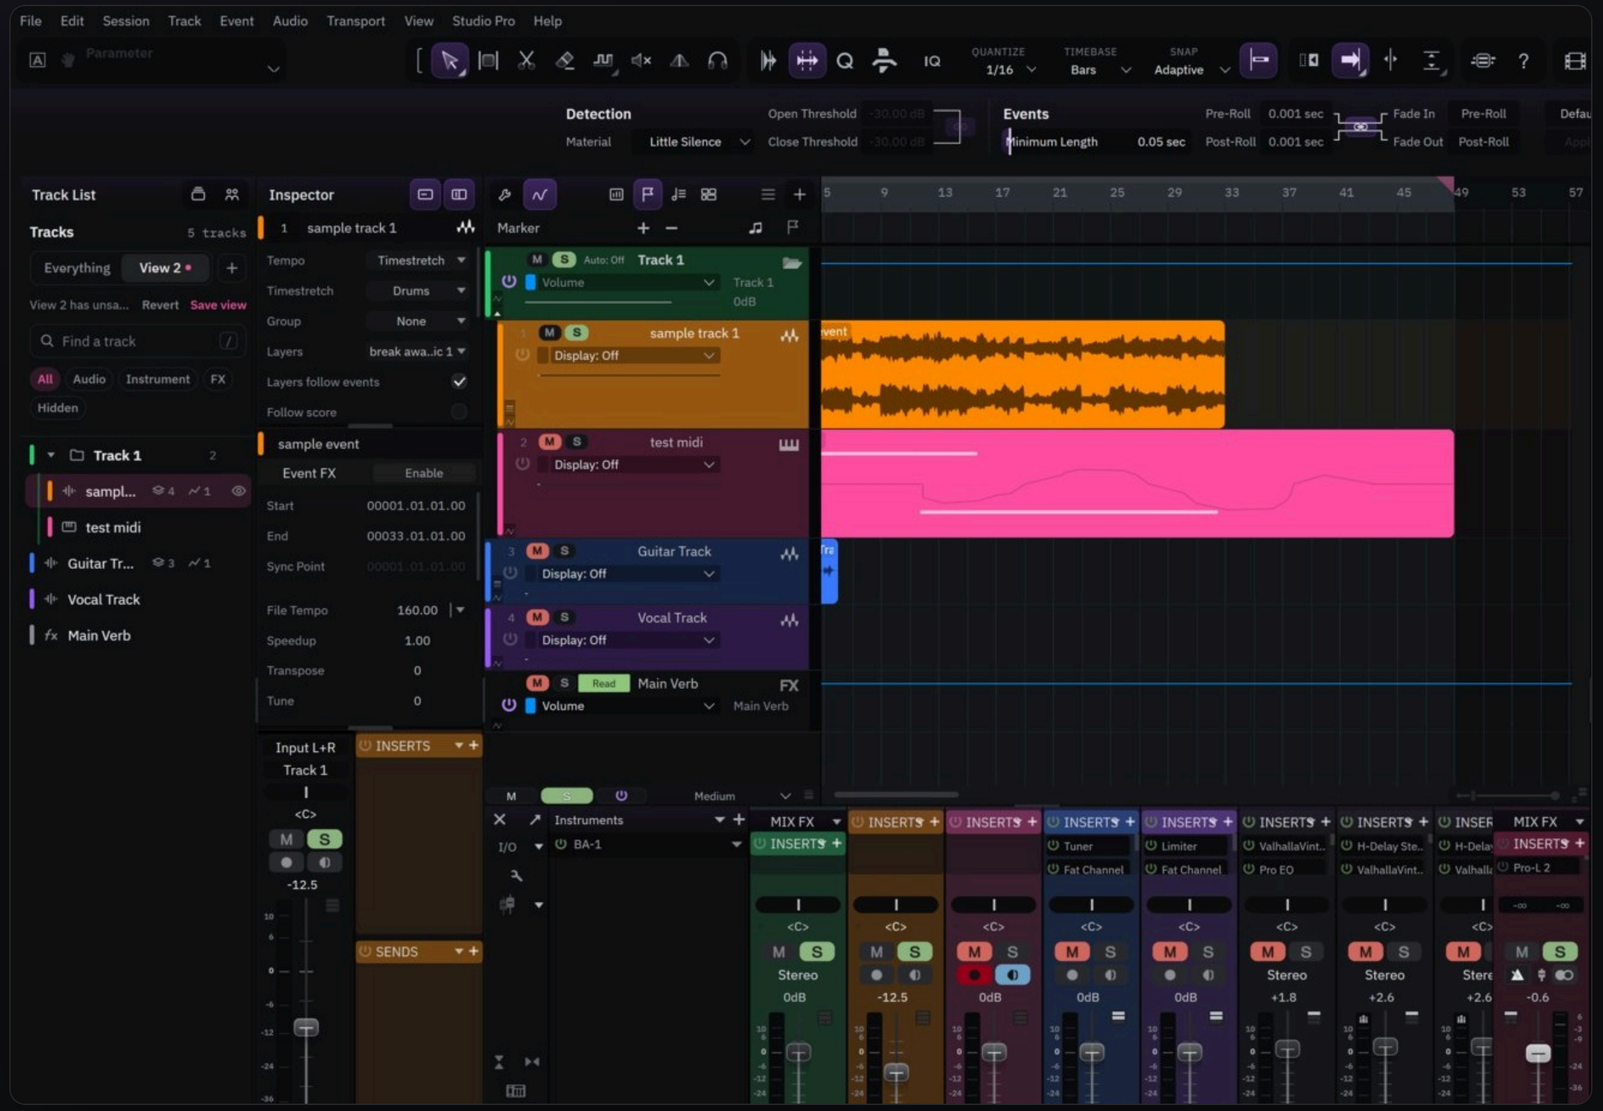

Same program, same songs. A calmer place to work.

Before Stock Studio Pro 8

After Studio Pro X, Liquid Glass skin

Liquid Glass

A dark, frosted skin for the whole window, with light that stays in the background.

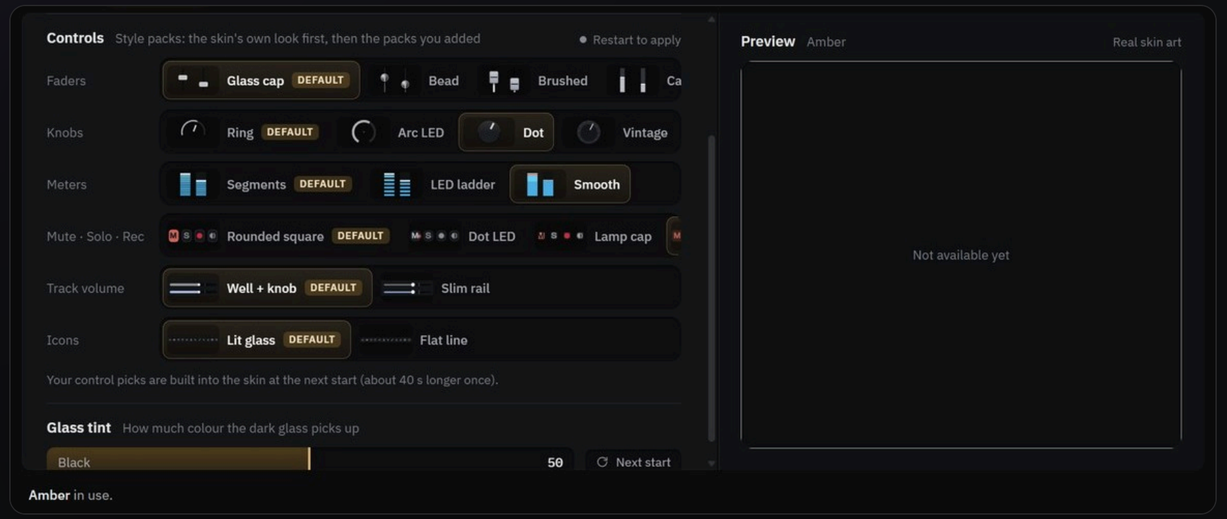

8 accents, 4 presets. 32 looks, switched from the Skins page.

One soft light. Your accent colour, from the top left. The Browser has its own glow. Or pick Cool zones.

Glass tint. From no tint to strong glass. No film grain.

Colour where it helps. The accent marks selection and sliders. Record, mute, solo and meters keep their colours.

Every corner. Toolbar, transport, inspector, mixer, editors. Track headers keep Studio Pro's own shapes.

`Options > Skins` pick Liquid Glass or Graphite, an accent, a tint and the lighting, then restart into it

Make your own skin from one short text file.

Start from a base, list only what you want different, run one command. No coding.

```
# themes/ocean.toml
[theme]
name = "Ocean"
base = "liquidglass"
swatches = ["#0F1012", "#1E1F23", "#7C7E86", "#3AC7E0"]
[accent]
hue = 189
[shape]
button = 10
```

A home page that starts with your music.

Your sessions

Your songs as folders you control on disk, with colour tags, search and Rename.

Music news

Headlines from public music feeds. One switch turns them off.

Your artist card

From your public Spotify page, when you turn the Spotify panel on.

Start fast

Templates and your audio device, one click away.

Switches Session library, News, Spotify panel (off at first) **Brings** Skins with it **No picture here** because the home page shows your own songs and names

Find tracks and plug-ins faster.

Track List

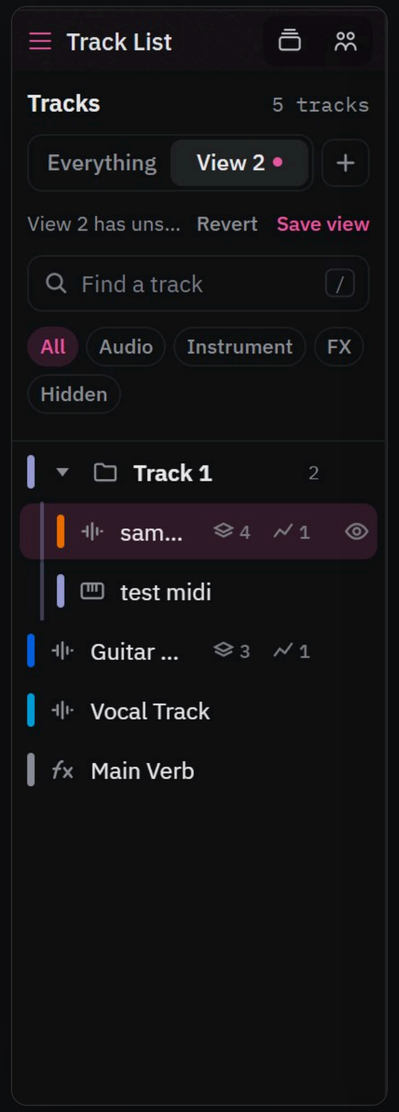

Eye buttons, search, type filters, folders, colours and saved views.

Package 04. Brings Skins with it.

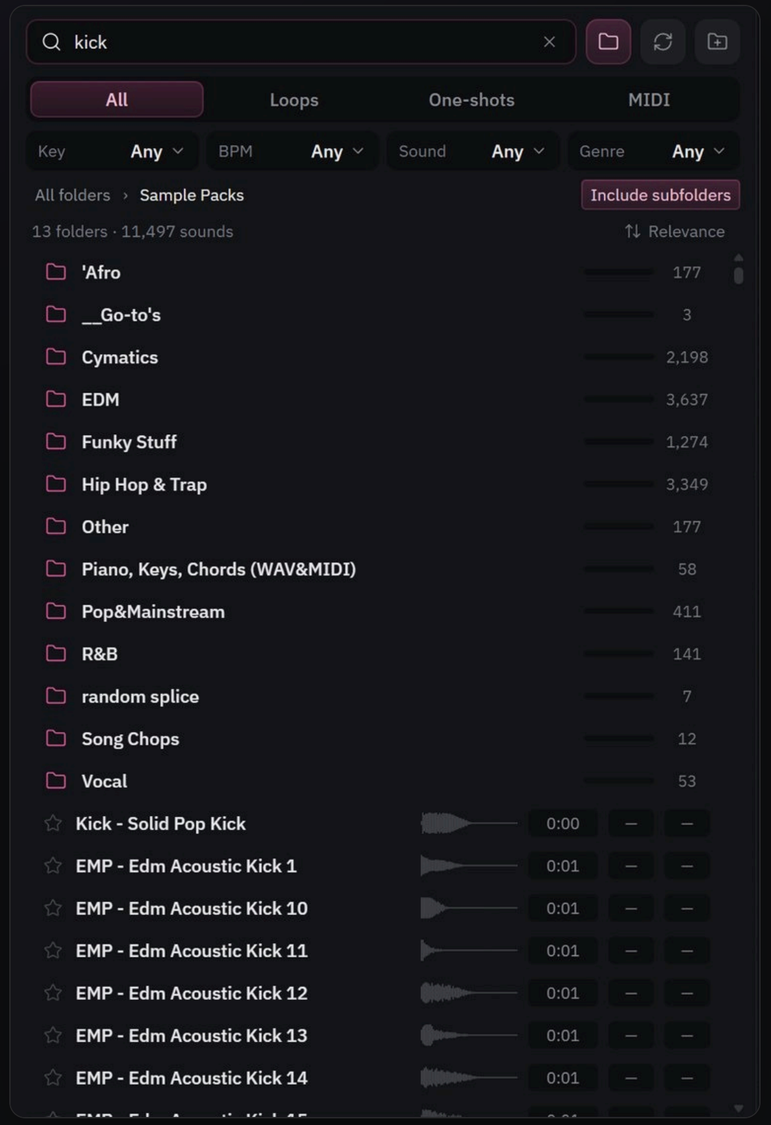

Plug-in browser

Search, filters, favourites, your own folders and a type icon on every row. `Enter` adds the plug-in to the selected track.

Package 05. Brings Skins with it.

Browser > Files Sound search

Sound Search

Search your own sample folders by name, key, tempo and type, fast even on a big library. Preview in time and in key with the song (MIDI files too, on the selected track), then drag it onto a track.

New in 1.3.0: **Play with song**. Loops and MIDI files start and stop with Studio Pro's Play and Stop and stay on the beat.

Package 06. Brings Skins with it.

YouTube panel

Browser > Cloud

Search or paste a link, preview, and download audio straight into the song's folder. Uses yt-dlp and ffmpeg, which you install yourself.

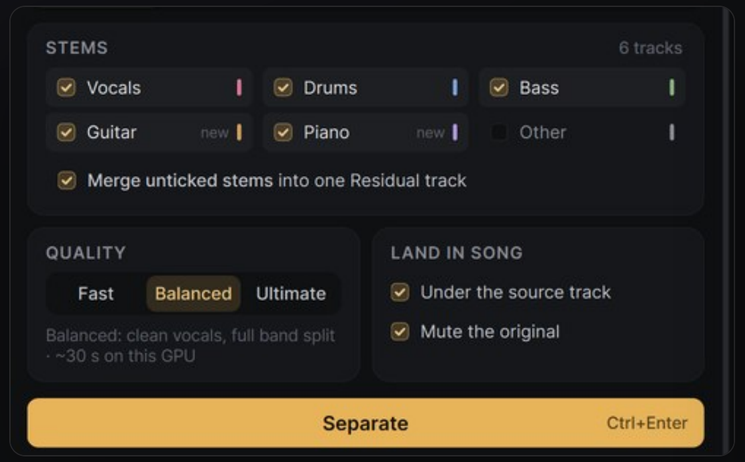

New in 1.4.0: previews work again, with a volume slider, and optional account tabs for your own Home, Subs, Liked, Later and History. Your sign-in stays on your PC.

Package 07. Off at first. Brings Skins with it.

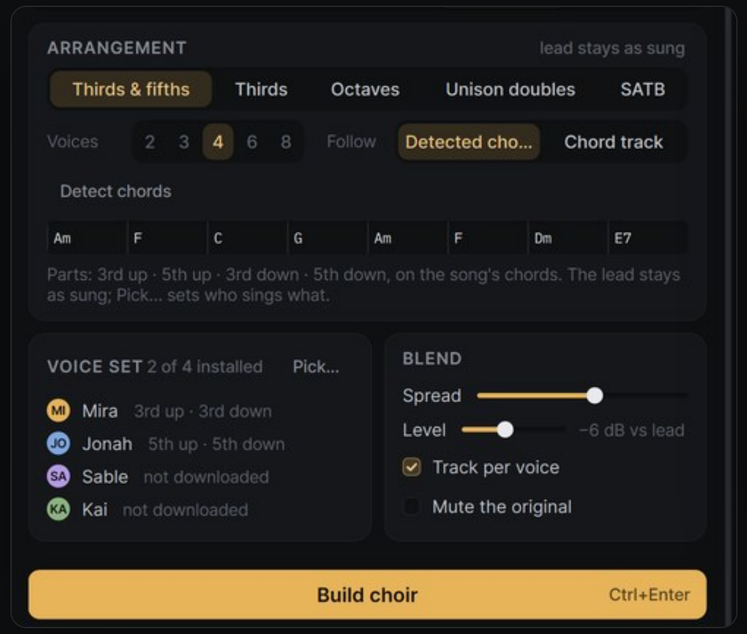

Only use audio you have the right to use.

AI Lab. Runs on your own PC.

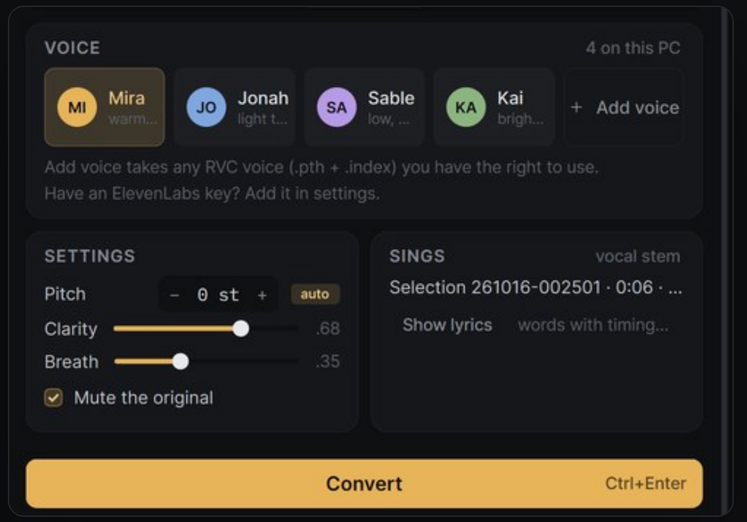

A new Browser tab with four sections, part of the AI tools package. Nothing is uploaded unless you add a key for an online service yourself.

Stems vocals, drums, bass, guitar, piano, other

Choir harmonies that follow the song's chords

Voice sing it with a ready-made voice

Generate makes music from a prompt with a local model. Default models are MIT or Apache licensed. Needs Studio Pro 8 (full version) and an NVIDIA GPU is strongly recommended. AI Lab always comes with the chat assistant & bridge: its Add to song button uses it.

An assistant that knows your song.

A chat panel in the Studio Assistant slot, talking to the AI model you choose with your own key. Part of the AI tools package.

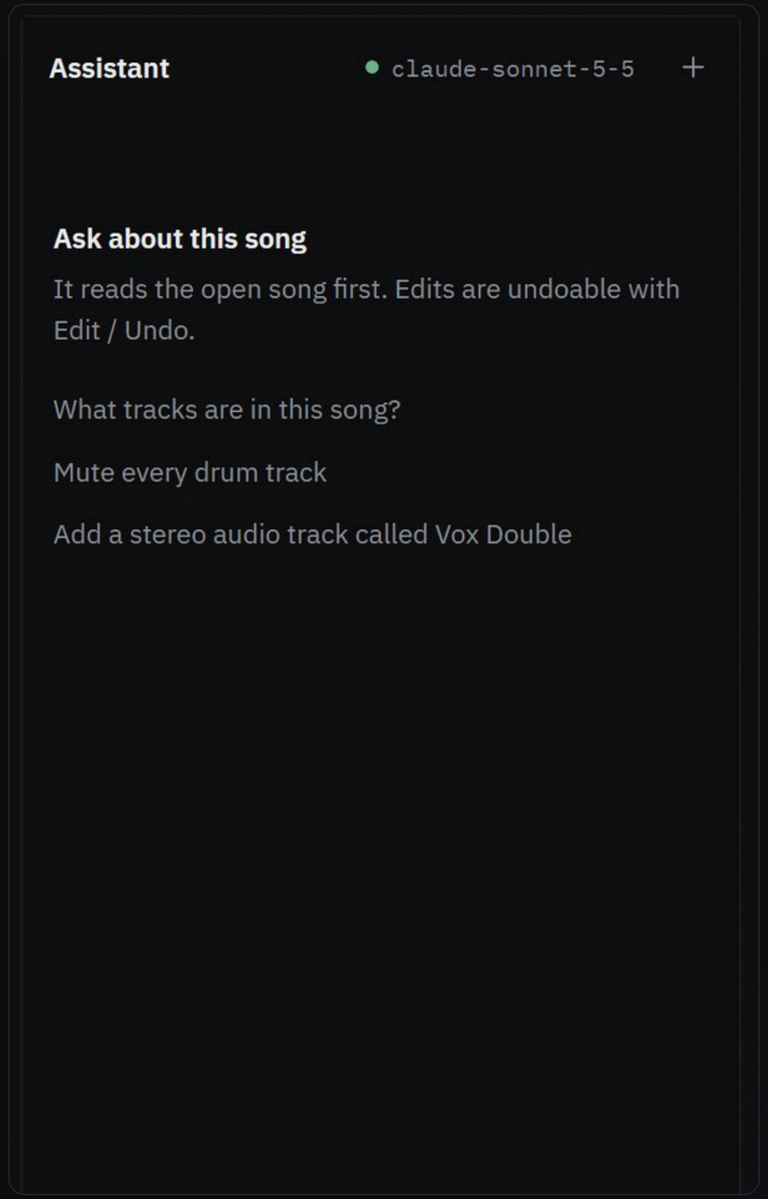

It reads the open song first, then answers or makes the change.

Every edit can be undone with Edit > Undo.

Stays on your PC. The bridge listens on this PC only. Nothing is sent until you add a key.

Any MCP assistant can drive Studio Pro through the same bridge.

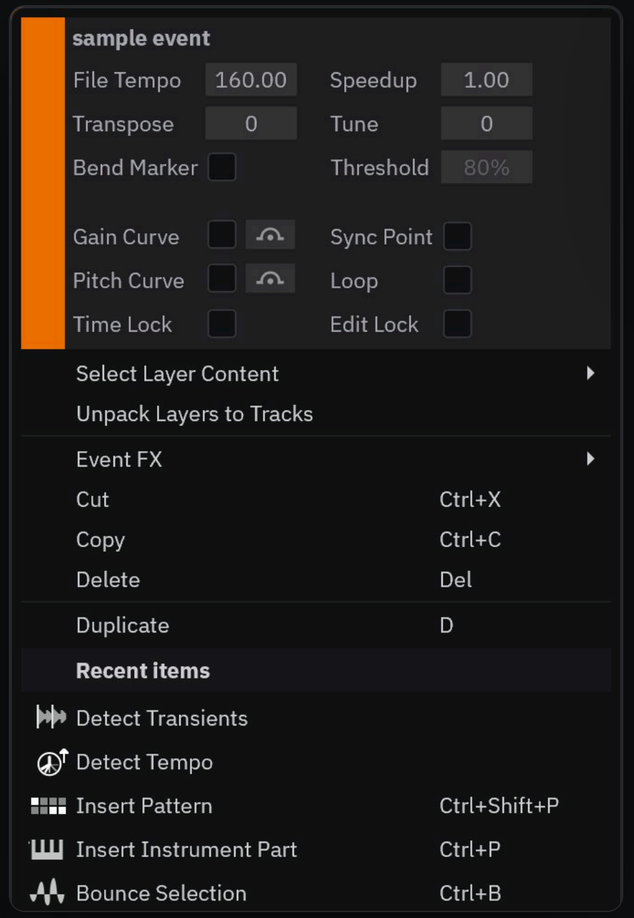

Comes with AI Lab. Its Add to song button uses the same bridge, so the two are installed together.

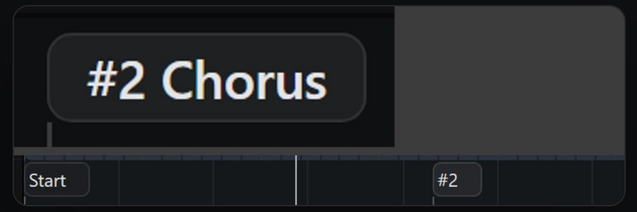

The small things, everywhere.

Mixer channel colours, quieter plug-in names, bypassed ones dimmed

Menus frosted; dialogs stay solid

Ruler rounded marker pills and loop

NEW IN 1.1.0

Polished, piece by piece.

Smooth backgrounds. The film grain is gone, everywhere.

One light. A single soft light in your accent colour, top left. The Browser gets its own glow from its bottom edge.

Cool zones. A second choice in a new Lighting row on the Skins page: a quiet cool light in each panel, the song grid left unlit. The newest part, so the least tested.

Glass tint that sticks. The slider saves properly now, and its top end is about three times the default.

Stock track headers. Studio Pro's own shapes, meter and colour effect. Plain neutral rows when track colours are off.

Transport. The tiles stay clean whatever you show or hide.

Scrollbars. The handle stays visible at every zoom.

Mixer. Quieter plug-in names, bypassed plug-ins clearly dimmed. Channel colour fills the whole strip, so the Skins page no longer asks.

Session library. Rename now works on the home page too.

Splash. The version number sits small in the window corner.

1.4.0: YouTube previews, volume, account tabs. 1.3.0: Sound search plays with the song. 1.2.x: cleaner, faster Sound search. Pictures predate 1.1.0.

The 10 packages at a glance

Tick the ones you want, with switches inside. Core (the mod loader and a web-panel crash guard) is always installed.

01 Skins

Liquid Glass and Graphite, built on your PC from your own Studio Pro, with a Skins page in Options and live colour changes.

`Skins page` `Live colours`

02 Home page

adds Skins

A calm Start page: your sessions, a Quick start card with your templates, music news, your artist card and your audio device.

`Session library` `News` `Spotify panel · off`

03 Name and icon

“Fender Studio Pro X” in the title bar and the X app icon.

`Hide About and Check for Updates · off`

04 Track List

adds Skins

A redesigned Track List with saved views, search and quick show/hide.

05 Plug-in browser

adds Skins

Instruments and Effects as a modern panel: filters, favourites, folders and search.

06 Sound search

adds Skins

Find samples by name, type, key and tempo in Browser > Files. Plays MIDI files too, in time with your song.

07 YouTube panel

off at first · adds Skins

Search YouTube audio in Browser > Cloud, preview it and bring it into your song, with optional account tabs (needs yt-dlp and ffmpeg).

08 Look extras

Smooth motion, glass pop-up menus, rounded ruler markers and loop.

`Smooth motion` `Glass pop-ups` `Ruler markers and loop`

09 Pitch curves

Draw and edit per-note pitch curves in the piano roll.

10 AI tools

off at first

A chat assistant that can drive Studio Pro (any MCP client too), the AI Lab tab, and optional better stems.

`Chat assistant & bridge` `AI Lab` `Better stems · off`

Dashed switch: off until you turn it on. “adds Skins”: the installer adds Skins for you, because the package uses its look.

Install in three steps.

1

Close and unzip

Close Studio Pro. Unzip the pack anywhere. Each package has its own folder and a short README.

2

Run Install

Double-click `Install.bat` and tick the packages you want, with switches under each. It adds what a package needs and shows a summary before it changes anything.

3

Build and pick

The skins are built on your PC from your own Studio Pro in 2 to 4 minutes. Then start it and pick a skin in Options > Skins.

Needs Windows 10 or 11, your own licensed Studio Pro 8 (tested on 8.1.2), Python 3.11+ with numpy, pillow, fonttools and brotli, and ImageMagick 7. The installer checks and tells you what is missing. It asks for administrator rights once, for the loader file. AI tools: AI Lab always comes with the chat assistant & bridge; Better stems is off at first (large download, it asks first).

Back to stock, any time.

`Shift`

For one start

Hold Shift while Studio Pro starts. You get the stock look for that start.

`Uninstall.bat`

Remove everything

Run the top-level one and Studio Pro is exactly stock again. Any file a package replaced comes back from the copy kept at install.

`packages\NN-name\Uninstall.bat`

Remove one package

Each package has its own. Packages that need it go too, and it tells you before it does anything.

`Install.bat again`

Change a switch

Run Install.bat again and untick the switch or the package. The summary shows what will be removed.

Your settings and songs are never moved. Saved views, favourites and folders are kept.

OUR PROMISE

Respect for the program, and for the people who make it.

Licensing stays untouched. No changes to sign-in, activation, subscriptions or the store. Ever.

No Fender files shipped. No skin files, images, fonts or program code. Skins are built on your PC from your own copy.

No surprises online. Only news, the artist card, YouTube, model downloads and keys you add go online, and each has an off switch.

Every change can be undone. Where a package replaces a stock file (the Moises tab, the SoundCloud panel), the original is kept and Uninstall puts it back.

Open and free. Our code is MIT licensed. Third-party models and tools keep their own licences.

Your projects come first. Settings and songs stay where they are. Back up as usual.

Thank you, Studio One team.

Studio One, now Fender Studio Pro, is the program this all builds on. Everything here exists because we love working in it.
